DIGITAL LITERACY

PROJECT REPORT

Task 1

I created an infographic slide using Prezi to explore essential aspects of digital literacy for students. The design presents five key topics in a visually engaging layout: digital literacy fundamentals, productivity tools for academic success, internet safety guidelines, building a professional online presence, and proper email communication etiquette.

The infographic employs a circular flow design with interconnected nodes, each representing a core concept. Digital literacy is positioned centrally, emphasizing its foundational role. Radiating outward are sections showcasing useful tools like Google Workspace, Notion, and citation managers; safe browsing practices including password security and privacy settings; strategies for maintaining professional social media profiles; and email etiquette rules covering subject lines, tone, and response timing.

Prezi's zooming interface allowed me to create depth and hierarchy, making complex information digestible. The non-linear canvas enabled smooth transitions between topics, enhancing viewer engagement.

The most interesting challenge was balancing information density with visual clarity. Fitting comprehensive content into a single slide without overwhelming viewers required careful text editing and strategic use of icons. Prezi's spatial arrangement helped, but determining optimal zoom levels and transition paths demanded multiple iterations to achieve the right flow.

Task 2

In my project report, I chose three main platform: LinkedIn, GitHub, and Kaggle. LinkedIn is a professional networking site where people share their skills, experiences, and connect with other professionals or companies. I plan to use it to build my online profile, show my projects, and connect with recruiters or mentors in the tech field.

GitHub is a platform for version control and code collaboration, mainly used by developers to store and share their code. I will use it over the next four years to host my academic projects, contribute to open-source, and keep a clean record of my coding progress.

Kaggle is a place for data science and machine learning competitions, datasets, and tutorials. I want to use it to practice data analysis, join competitions, and improve my skills in Python, ML, and statistics.

Using all three platforms together will help me grow as a student and future developer, by showing my learning journey, building a strong online presence, and staying active in real-world tech communities.

Task 3

For my project, I used HackerRank as the main platform for coding practice. HackerRank is a online coding platform where students can solve problems in different programming languages and improve their logical thinking. On this platform, I mainly practiced C++, C, Python, and Data Structures and Algorithms (DSA).

I built small programs like array manipulations, string operations, sorting algorithms, and basic recursion problems. Doing these exercises helped me understand how to write clean and efficient code, and also improved my problem-solving speed.

These tools will help me a lot academically because most of our computer science subjects are based on programming and algorithms. Practicing on HackerRank will prepare me for exams, assignments, and coding tests in college. It will also give me confidence when I appear for internships or placements in future. Overall, using HackerRank regularly has made me more comfortable with coding and has supported my learning in subjects like DSA, programming labs, and competitive problem-solving.

Task 4

when a student misunderstood a sarcastic comment on Twitter and replied in an angry way, which then turned into a public argument. The original tweet was meant as a joke, but the student took it seriously and posted a harsh reply, tagging the person and using strong words. Others started commenting and sharing the thread, and soon the student' s profile got negative attention and even some online bullying.

This problem happened because of poor digital communication and low digital literacy. The student could have paused, checked the context, and maybe sent a private message instead of reacting publicly. Using a calmer tone, thinking before posting, and understanding how sarcasm can be misread online would have helped avoid the whole conflict.

Task 5

What surprised me most while researching the "Stay Safe Online" checklist was how many common habits people think are safe but can actually be risky. For example, using the same password across multiple sites or clicking on short links in social media without checking them. I also didn' t realise how fast personal data can spread once it is shared online, even in private groups.

As a result, I will personally change my password habit. From now on, I will use different strong passwords for each account and try to use a password manager instead of writing them in notes. I will also be more careful before sharing photos, links, or personal details on social media and always think twice before clicking on unknown links. This small change will help me stay safer and more responsible online.
